Dear Hiring Team,

I build and maintain production AI software at Botpress, and I have contributed fixes merged into Google's Agent Development Kit and the AWS CDK CLI.

At Botpress, I lead development of a reusable Shopify agent kit (https://worksofabhiram.live/botpress-ecommerce-shopping-agent-kit-case-study) covering shopping, orders, returns and human handoff. My work includes automated store onboarding, checks against source prices and policies, and approval controls for refunds. I also designed and built Agentic Reporter, a conversation analytics product that computes report figures in code and rejects generated drafts containing unsupported numbers.

My upstream contributions provide public examples of how I approach correctness. In AWS CDK (https://github.com/aws/aws-cdk-cli/pull/2107), I fixed repeated CLI arguments that could cause a deployment to perform no work while returning a successful exit code. In Google ADK (https://github.com/google/adk-js/pull/1169), I fixed internal workflow inputs being persisted as messages the user never sent. Both changes were merged and include regression tests. The pull requests document the failure cases, implementation choices and tests.

I'm looking for a role where I can take responsibility for production software, work directly with the people using it, and turn recurring problems into reusable tools. I would welcome a technical discussion of these systems and the decisions behind them.
